

Dear CROSS Solutions Team,

I am a Software Engineer specializing in backend systems, distributed architecture, and scalable platform engineering. Through my experience at Tedekstra and Milanam, along with building high-performance systems independently, I have consistently focused on designing resilient, production-grade software built for scale.

At **Tedekstra**, I built modular CRM backend services with NestJS, TypeScript, and PostgreSQL, improving delivery velocity by 25%. I standardized validation and error handling, increasing API reliability and reducing redundant calls by 30%. I also optimized frontend state management, lowering perceived latency by 35%.

At **Milanam**, I architected and shipped a scalable marketplace using Express.js, MongoDB, and TypeScript in a Turborepo monorepo. I implemented secure JWT authentication with refresh rotation and RBAC, enabling stateless scaling. I optimized indexing and Dockerized infrastructure, reducing CI/CD time by 30% and supporting 10K+ monthly workflows.

Beyond internships, I have built distributed systems including:

- A workflow automation engine processing 100K+ events/day using Kafka with the Transactional Outbox Pattern (99.99% event reliability).
- A high-frequency exchange engine handling 10K+ orders/sec with sub-50ms latency using Redis Pub/Sub and WebSockets.
- A financial transaction system ensuring strict ACID compliance using PostgreSQL row-level locking and idempotent workflows with zero double-spend inconsistencies.

I am deeply interested in building scalable APIs, event-driven systems, and performance-critical backend infrastructure. I thrive in environments where ownership, architectural thinking, and technical depth are valued.

I would welcome the opportunity to contribute to your team and help engineer systems designed for reliability, scale, and long-term growth.

Sincerely,
Amit Kumar Gupta
